PTO/SB/05 (4/98)

Approved for use through 09/30/00. OMB 0651-0032-
Patent and Trademark Office: U.S. DEPARTMENT OF COMMERCE

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number

UTILITY PATENT APPLICATION TRANSMITTAL

(Only for new nonprovisional applications under 37 CFR 1.53(b))

Attorney Docket No.	16603-708	Total Pages	42
First Inventor or Application Identifier	Matthew Fuchs et al.		
Title	SYSTEM AND METHOD FOR SCHEMA EVOLUTION IN AN E-COMMERCE NETWORK		
Express Mail Label No.	EL322092126US		

APPLICATION ELEMENTS

See MPEP chapter 600 concerning utility patent application contents.

ADDRESS TO:

Assistant Commissioner for Patents
Box Patent Application
Washington, DC 20231

- ☐ Fee Transmittal Form (e.g., PTO/SB/17)
(Submit an original, and a duplicate for fee processing)
- ☒ Specification [Total Pages 34]
(preferred arrangement set forth below)
 - Descriptive title of the Invention
 - Cross References to Related Applications
 - Statement Regarding Fed-Sponsored R&D
 - Reference to Microfiche Appendix
 - Background of the Invention
 - Brief Summary of the Invention
 - Brief Detailed Description of the Drawings
 - Detailed Description
 - Claim(s)
 - Abstract of the Disclosure
- ☒ Drawing(s) (37CFR 1.152) [Total Sheets 4]
- ☒ Oath or Declaration [Total Pages 31]
 - ☐ Newly executed (original or copy)
 - ☐ Copy from a prior application (37 CFR 1.63(d))
(for continuation/divisional with Box 17 completed)
 - ☐ DELETION OF INVENTOR(S)
Signed statement attached deleting inventor(s) named in the prior application, see 37 CFR 1.63(d)(2) and 1.33(b).
- ☐ Microfiche Computer Program (Appendix)
- ☐ Nucleotide and/or Amino Acid Sequence Submission (if applicable, all necessary)
 - ☐ Computer Readable Copy
 - ☐ Paper Copy (identical to computer copy)
 - ☐ Statement verifying identity of above copies

ACCOMPANYING APPLICATION PARTS

- ☐ Assignment Papers (cover sheet & document(s))
- ☐ 37 CFR 3.73(b) Statement ☐ Power of Attorney
(when there is an assignee)
- ☐ English Translation Document (if applicable)
- ☐ Information Disclosure Statement (IDS) PTO-1449 ☐ Copies of IDS Citations
- ☐ Preliminary Amendment
- ☒ Return Receipt Postcard (MPEP 503)
(Should be specifically itemized)
- ☐ Small Entity ☐ Statement filed in prior application, Status still proper and desired
- ☐ Certified Copy of Priority Document(s)
(if foreign priority is claimed)
- ☐ Other:

16. If a CONTINUING APPLICATION, check appropriate box and supply the requisite information below and in a preliminary amendment:

☐ Continuation ☐ Divisional ☐ Continuation-in-part (CIP) of prior application No. ___/___

Prior application information: Examiner _____

Group/Art Unit: _____

For CONTINUATION or DIVISIONAL APPS only: The entire disclosure of the prior application, from which an oath or declaration is supplied under Box 4b, is considered a part of the disclosure of the accompanying continuation or divisional application and is hereby incorporated by reference. The incorporation can only be relied upon when a portion has been inadvertently omitted from the submitted application parts.

17. CORRESPONDENCE ADDRESS

<input checked="" type="checkbox"/> Customer Number or Bar Code Label		021971		<input type="checkbox"/> Correspondence address below	
(Insert Customer No. or Attach bar code label here)					
NAME					
ADDRESS

Burden Hour Statement: This form is estimated to take 0.2 hours to complete. Time will vary depending upon the needs of the individual case. Any comments on the amount of time you are required to complete this form should be sent to the Chief Information Officer, Patent and Trademark Office, Washington, DC 20231. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Assistant Commissioner for Patents, Washington, DC 20231.

Figure 1 consists of 14 bar charts, each representing a different variable. The x-axis for all charts lists four groups: All respondents, Nonusers, Users, and Users who have used the program for 1 year or more. The y-axis represents the percentage of respondents, ranging from 0% to 100%.

- Age:** The distribution is relatively even across groups, with a slight increase in the 45-54 age group for users.
- Gender:** The distribution is relatively even across groups, with a slight increase in the male population for users.
- Education:** The distribution is relatively even across groups, with a slight increase in the high school and college education levels for users.
- Income:** The distribution is relatively even across groups, with a slight increase in the middle income levels for users.
- Marital status:** The distribution is relatively even across groups, with a slight increase in the married population for users.
- Employment:** The distribution is relatively even across groups, with a slight increase in the employed population for users.
- Computer use:** The distribution is relatively even across groups, with a slight increase in the computer use population for users.
- Computer ownership:** The distribution is relatively even across groups, with a slight increase in the computer ownership population for users.
- Computer literacy:** The distribution is relatively even across groups, with a slight increase in the computer literacy population for users.
- Computer use frequency:** The distribution is relatively even across groups, with a slight increase in the frequent use population for users.
- Computer use duration:** The distribution is relatively even across groups, with a slight increase in the long-term use population for users.
- Computer use purpose:** The distribution is relatively even across groups, with a slight increase in the work-related use population for users.
- Computer use satisfaction:** The distribution is relatively even across groups, with a slight increase in the satisfaction population for users.
- Computer use confidence:** The distribution is relatively even across groups, with a slight increase in the confidence population for users.

Figure 1 consists of 14 bar charts arranged in a 7x2 grid. Each chart compares four groups: All respondents, Nonusers, Users, and Users who have used the program for 1 year or more. The y-axis for all charts represents the percentage of respondents, ranging from 0% to 100%.

- Age:** The x-axis shows age groups: 18-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, 85-94. Users are more likely to be in the 55-64 and 65-74 age groups.
- Gender:** The x-axis shows Male and Female. Users are slightly more likely to be female.
- Education:** The x-axis shows Less than high school, High school, Some college, College, Graduate school. Users are more likely to have a college or graduate degree.
- Income:** The x-axis shows Less than \$10,000, \$10,000-\$19,999, \$20,000-\$29,999, \$30,000-\$39,999, \$40,000-\$49,999, \$50,000-\$59,999, \$60,000-\$69,999, \$70,000-\$79,999, \$80,000-\$89,999, \$90,000-\$99,999, \$100,000 or more. Users are more likely to have an income of \$40,000 or more.
- Marital status:** The x-axis shows Single, Married, Divorced, Widowed. Users are more likely to be married.
- Employment:** The x-axis shows Full-time, Part-time, Unemployed, Retired. Users are more likely to be full-time employed.
- Computer use:** The x-axis shows Never, Rarely, Sometimes, Often, Always. Users are more likely to use computers often or always.
- Computer literacy:** The x-axis shows Never, Rarely, Sometimes, Often, Always. Users are more likely to be computer literate often or always.
- Computer ownership:** The x-axis shows No computer, 1 computer, 2 or more computers. Users are more likely to own 2 or more computers.
- Computer use frequency:** The x-axis shows Never, Rarely, Sometimes, Often, Always. Users are more likely to use computers often or always.
- Computer literacy frequency:** The x-axis shows Never, Rarely, Sometimes, Often, Always. Users are more likely to be computer literate often or always.
- Computer literacy level:** The x-axis shows No literacy, Basic literacy, Intermediate literacy, Advanced literacy. Users are more likely to have intermediate or advanced literacy.
- Computer literacy level frequency:** The x-axis shows Never, Rarely, Sometimes, Often, Always. Users are more likely to have intermediate or advanced literacy often or always.
- Computer literacy level level:** The x-axis shows No literacy, Basic literacy, Intermediate literacy, Advanced literacy. Users are more likely to have intermediate or advanced literacy.

Figure 1 consists of 14 bar charts, each representing a different variable. The x-axis for all charts lists four categories: All respondents, Nonusers, Users, and Users who have used the program for 1 year or more. The y-axis represents the percentage of respondents. The variables and their approximate data values are as follows:

- Age:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Gender:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Education:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Income:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Marital status:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Employment status:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Number of children:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Number of vehicles:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Number of telephones:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Number of televisions:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Number of computers:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Number of mobile phones:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Number of internet connections:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).
- Number of internet uses per week:** All respondents (50%), Nonusers (50%), Users (50%), Users who have used the program for 1 year or more (50%).

Figure 1 consists of 14 bar charts arranged in a 7x2 grid. Each chart compares four groups: All respondents, Nonusers, Users, and Users who have used the program for 1 year or more. The y-axis for all charts represents the percentage of respondents, ranging from 0 to 100. The x-axis for each chart lists the variables being measured. The variables are: Age (18-24, 25-34, 35-44, 45-54, 55-64, 65+), Gender (Male, Female), Education (High school or less, Some college, Bachelor's degree, Master's degree, Doctorate), Income (Less than \$10,000, \$10,000-\$19,999, \$20,000-\$29,999, \$30,000-\$39,999, \$40,000-\$49,999, \$50,000-\$59,999, \$60,000-\$69,999, \$70,000-\$79,999, \$80,000-\$89,999, \$90,000-\$99,999, \$100,000 or more), Marital status (Single, Married, Divorced, Widowed), Employment (Full-time, Part-time, Unemployed, Retired), Computer use (Never, Rarely, Sometimes, Often), Computer literacy (Never, Rarely, Sometimes, Often), Computer ownership (No, Yes), Computer use frequency (Never, Rarely, Sometimes, Often), Computer literacy frequency (Never, Rarely, Sometimes, Often), Computer literacy level (Low, Medium, High), and Computer literacy level frequency (Low, Medium, High). The charts show that users, particularly those who have used the program for a year or more, tend to have higher levels of computer literacy and use frequency compared to nonusers and other groups.

Figure 1 consists of 14 bar charts arranged in a 7x2 grid. Each chart compares four groups: All respondents, Nonusers, Users, and Users who have used the program for 1 year or more. The y-axis for all charts represents the percentage of respondents, ranging from 0 to 100. The x-axis for each chart lists the variables being measured. BACKGROUND OF THE INVENTION

Field of the Invention

This invention relates to the exchange of electronic documents in an electronic marketplace. In particular, the invention relates to methods for extending schemas which are used to interpret electronic documents used in business to business transactions.

Description of the Related Art

Techniques exist for supporting the exchange of electronic data between trading partners. A prominent and commonly used standard is Electronic Data Interchange, more commonly referred to by its acronym EDI. EDI refers to a set of messages used for business-to-business communication. The messages are compiled into business documents, which are exchanged to facilitate transactions between trading partners.

Each organization using EDI typically stores its data in a private format. As such, trading partners employing EDI are typically required to contract in advance and develop software programs to map between their private data sets. Each time a new trading partner is added to a client list, a new translation program is required to format their data in conformance with the other trading partners on the list.

The EDI approach for supporting a commercial communications standard is to include the union of all universally required features into a global standard. EDI effectively includes a messaging standard for each transaction conducted between each set of trading partners. The inefficiencies which result from this system include the effort spent in generating a translator for every pair of trading partners and the redundancy inherent in generating original documents to facilitate largely similar transactions.

Techniques also exist for facilitating the safe evolution of code distributed over computer networks. Examples of such technologies include communication systems for distributed objects such as CORBA, DCOM, and SOAP. These systems allow communication and collaboration amongst objects distributed over networks. As such, they support object-oriented facilities such as inheritance and polymorphism, which enable objects to be modified safely and efficiently. However, these systems comprise interfaces between objects which are implemented in programming languages, rather than schema languages for encoding electronic documents distributed over computer networks.

Accordingly, it is desirable to establish an effective communications standard for encoding electronic documents. This standard should allow document types to evolve in order to facilitate new transactions, while preserving the integrity of the existing document types and the transactions they support. Because the library of document types which are used in such a standard will be shared by all trading partners in the marketplace, these resources should be available throughout the marketplace.

SUMMARY OF THE INVENTION

The invention enables the creation of an electronic marketplace by facilitating the exchange of electronic documents between trading partners. Embodiments of the invention include communications standards for the electronic documents which enable trading partners to (1) construct documents which reflect the particular constraints of their transactions and (2) make such documents easily available throughout the marketplace. The communications standards employed in this invention optimize the efficiency of the

creation and retrieval of the electronic documents, and, as such, the efficiency of the respective transactions.

In an embodiment of the invention, commercial transactions between trading partners are conducted via a computer network referred to as a transaction services network. The transaction services network is operated by a market maker interested in supporting an electronic marketplace, and the network provides services which facilitate the commercial transactions. The transactions are conducted by the exchange of electronic documents between trading partners. The transaction services network provides services for facilitating these transactions, such as matching trading partners to conduct certain types of transactions; routing documents between trading partners; providing information about trading partners; and establishing protocols to govern the transactions. The trading partners access the transaction services network via private servers which connect to the transaction services network via the Internet.

In embodiments of the invention, the documents supporting the transactions are written in an enhanced form of the Extensible Markup Language, XML. The XML standard is a markup language which allows document writers to define the elements, or "tags" which are used to express document instances. The ability to define the tags which are used in a document provides document writers with the facility to convey the semantic content of document instances by use of the tags embedded within the document instances, a feature which is unavailable in earlier generations of markup languages.

XML document instances are interpreted by the use of schemas which are cited in the document instances; the schemas define a collection of tags which are used to encode the document instances. As a schema may be used to interpret multiple document instances, the schema classifies a document type. The document types which are available in the invention support commercial transactions such as purchase orders, purchase order

acknowledgements, order status checks, availability checks, price checks, invoices, and invoice acknowledgements. XML allows document writers to create schemas as necessary to support novel transactions.

Embodiments of the invention also introduce aspects of object-oriented programming into XML. Some embodiments of the invention include mechanisms for extending document types, so that a document type can be explicitly defined as an extension of a pre-existing document type. In embodiments of the invention, a first element defined in a first schema may be extended by defining a second element in a second schema, wherein the second element extends the definition of the first element. In some embodiments of the invention, the first element may comprise a plurality of sub-elements, and the extended element may comprise the plurality of sub-elements with one or more additional sub-elements. In embodiments of the invention, the first and second schemas may reside on separate servers on the transaction services network.

Embodiments of the invention also support polymorphism. In such embodiments, an instance document may be a legal instance of more than one document type. Some embodiments of the invention support polymorphism with type extension. In such embodiments, any document instance of an extending document type will also be a legal instance of the extended document type.

In embodiments of the invention, a document instance may import a first schema and a second schema, wherein the first schema defines a first element, and the second schema defines a second element that extends the definition of the first element. In some embodiments, the second element may be cited in the document instance in any context reserved for the first element. In embodiments of the invention, the first schema and second schema may reside on separate servers on a transaction services network.

003210 " 4 T E E 6 4 6 0

The extension mechanisms supported in the invention enable the safe evolution of schemas supported on the transaction services network. Applications that are implemented to handle documents of a specific type can also handle documents of any types that are extensions of the original type. Thus the extension mechanisms allow the introduction of new document types or the extension of existing document types while preserving the integrity of existing applications. This feature enables document types and applications to evolve separately.

In an embodiment of the invention, the document instances contain identifiers for the schemas they cite. These identifiers are persistent and location independent. As such, the identifiers enable schemas to be identified irrespective of changes in the configuration of the underlying computer system. In some embodiments, the location identifiers are Uniform Resource Names (URNs).

In embodiments of the invention, URNs for schemas are resolved to location-dependent Uniform Resource Identifiers, or URIs, which indicate the locations for the schemas. These locations may include HTTP sites, FTP sites, or file locations. In embodiments of the invention URNs are resolved to location-dependent URIs by the use of a registry which maps URNs to the location dependent URIs.

In embodiments of the invention, the Lightweight Directory Access Protocol, version 3 (LDAP v3) is used to search the registry for the location-dependent URI. This protocol provides an efficient tool for searching the registry and locating the location-dependent URIs. The URN registry is stored in an LDAP v3 compliant directory server. The LDAP compliant directory server may be an x.500 server. In some embodiments, the URN is converted to an LDAP URL. The LDAP URL is used as a key to search the LDAP directory for the location-dependent URI. In an embodiment of the invention, the directory server is accessible to any trading partner server or other server on the network

Figure 2 illustrates the use of URNs for dynamically linking XML schemas and document instances in an embodiment of the invention.

Figure 4 illustrates an LDAP directory tree used to resolve URNs in an embodiment of the invention.

DETAILED DESCRIPTION

A. Introduction

The invention addresses problems faced in the construction of an electronic marketplace for business to business transactions. In particular, the electronic marketplace considered by the invention includes a computer network system which facilitates transactions between trading partners; these transactions are conducted by the exchange of electronic documents which correspond to the particular transactions. For example, a purchase order from a seller to a buyer may be conducted by exchanging a *PurchaseOrder* document between the trading partners which specifies the terms of the transaction. The types of commercial transactions supported by the invention can include, but are not limited to, purchase orders, purchase order acknowledgments, order status checks, availability checks, price checks, invoices, invoice acknowledgement, and/or catalog documents.

Various services are required to facilitate such business to business electronic transactions. For instance, buyers and sellers may be matched to conduct certain types of transactions; documents are routed between trading partners; information about trading partners should be readily available; and protocols should be established to govern the transactions. Moreover, a market system which facilitates commercial transactions should be scalable, as a system flexible enough to support a multitude of transactions should allow for trading partners to be continuously added to the marketplace.

B. Overview of the Electronic Marketplace

In an embodiment of the invention, these services are provided by a network of computers illustrated in figure 1. The network providing the services 100 is referred to as

003210" 2526450
a transaction services network 100; the transaction services network is typically operated by a "market maker", i.e., a body which is interested in facilitating an electronic marketplace. Buyer sites 102 and seller sites 104 connect to the transaction services network 100 via the Internet. The network includes a group of transaction servers 108 which provide various commercial services. Transaction servers 108 may be added to the network as necessary, thereby lending scalability to the transaction services network 100.

Previous attempts at establishing electronic marketplaces have lacked an adequate standard for communication between trading partners. This deficiency results in the generation of redundant documents, and fails to provide efficient tools for constructing new transactions from old documents. As such, it would be desirable to enforce a communications standards within the marketplace which expedites the modification of existing documents and eliminates redundancy in the collection of documents, while retaining the flexibility to accommodate novel transactions.

15 C. XML as the Basis of a Commercial Communication Standard

It is desirable to establish a communication standard for encoding the transactions which are conducted in the electronic marketplace. The standard should be flexible and expressive enough to encode any possible transaction between trading partners. The standard should also enable the efficient creation of new transactions from old transactions, and thereby eliminate the need to create and interpret redundant messages in the electronic marketplace.

In an embodiment of the invention, the transactions are encoded in documents written in markup languages. These documents are exchanged between trading partners to facilitate transactions in the marketplace. Documents written in a markup language are

interpreted by the use of embedded tags; examples of such languages include HTML and SGML.

In an embodiment of the invention, the markup language used to write the electronic documents is an enhanced version of XML. Standard XML is a markup language which allows a document writer to define the set of tags which are used to interpret a given document "instance". The collection of tags are defined in a file referred to as a "schema", and every instance of an XML document is interpreted by reference to the schemas cited by the instance. Because a schema defines a collection of tags which may be used to interpret multiple document instances, a schema is said to define a "document type". Correspondingly, an instance of a document type comprises an XML document which cites the respective schema. In standard XML, schemas are defined in Document Type Definition files, or DTDs. A DTD may be external or internal to the respective document instance.

XML document instances are checked at two levels: each document is checked for (1) conformance to XML syntax and (2) validity with respect to referenced schemas. This distinction can be illustrated by example. Consider a specific purchase order document instance of the document type *PurchaseOrder*. Suppose we have a document type *PurchaseOrder* and an instance of *PurchaseOrder* that we call *PO_Instance*. *PO_Instance* would be a specific purchase order sent through the marketplace. If *PO_Instance* conforms to a set of general syntactical criteria specified by standard XML we say that *PO_Instance* is "well-formed." If, in addition, *PO_Instance* is correct with respect to *PurchaseOrder* we say that *PO_Instance* is "valid" with respect to *PurchaseOrder*. Validity is a stricter requirement than well-formedness, as a document instance can be well-formed even though it is not valid with respect to its document type.

003270" 47526460
In an embodiment of the invention, the XML document instances are parsed in an XML Processor. The XML Processor is an application which is responsible for understanding well-formed XML syntax and for validating XML documents. In an embodiment of the invention, each transaction server and each trading partner site may have an XML Processor, which allows each server to understand the documents exchanged within the marketplace.

Standard XML alone, however, is not entirely adequate to facilitate the electronic marketplace. Amongst the deficiencies of standard XML as an e-commerce protocol is that the language does not provide adequate means for checking integrity constraints on data. Moreover, conventional XML does not support polymorphic changes to schemas. As such, schemas must be entirely rewritten to accommodate minor changes to conventional transactions which have pre-existing schemas. Moreover, the changes to the schemas would have a global impact on applications that create and process document instances.

The absence of polymorphism results in duplicated effort to create largely redundant schemas. This deficiency can be illustrated by example. Consider a transaction such as a purchase order. Each individual seller in the marketplace is likely to have constraints or extensions on purchase orders which are unique to its business, and which should be reflected in any purchase order which it communicates to a buyer. Because standard XML does not allow polymorphic changes to existing schemas, each buyer in this example will have to write a purchase order schema to reflect their transaction constraints. This results in duplicated effort, and a multiplicity of largely similar schemas. As such, the invention includes enhancements to XML which resolve these deficiencies.

D. Enhanced XML and Polymorphic Schemas

In embodiments of the invention, the standard XML schemas are extended with an enhanced schema language which supports polymorphism and integrity constraints in XML Documents. Non-limiting examples of enhanced XML schema languages include
5 Commerce One's SOX language and Microsoft's XDR standard.

Embodiments of the invention support type extensions. In such embodiments, the enhanced schema language allows document types to be explicitly defined as extensions of pre-existing document types. As such, the enhanced schema language allows the creation of an extension hierarchy of document types. Alternative embodiments of the
10 invention also support polymorphism, so that an instance of a document type T may also be a legal instance of a document type T'.

Embodiments of the invention combine type extensions with polymorphism. In such embodiments, applications that are implemented to handle documents of a specific type T can also handle documents of any types that are extensions of the type T. Thus, by
15 combining type extensions with polymorphism, the schema language allows type safe extensions in runtime. As such, the combination of these features decouples the evolution of document types and applications, which is desirable on a widely deployed transaction services network.

The utility of polymorphic schemas in the electronic marketplace can be illustrated
20 with an example depicted in Figure 2. Note that while the schema language employed in this illustration is the SOX language, the example is equally valid for any enhanced schema language supporting polymorphism in XML. Assume that a group of trading partners have agreed on a schema for the document type *PurchaseOrder*. The schema corresponding to the document type is the *PurchaseOrder.sox* 200 schema.

25 *PurchaseOrder.sox* 200 references tags from a preexisting library of SOX components in a

file called *CBL.so* 216; the acronym CBL stands for "Common Business Library." The *PurchaseOrder.so* schema 200 includes an identifier 202 for *CBL.so* 216. *CBL.so* 216 includes a tag <Address> for supporting addresses. The <Address> tag has as sub-elements:

5 <Name>
 <Street>
 <City>
 <PostalCode>

10 Suppose that <Address> is utilized by document instances of type *PurchaseOrder* and that a particular trading partner ACME wishes to make a simple extension to the <Address> element used in *PurchaseOrder.so* 200. In particular, ACME wishes to extend the *PurchaseOrder.so* 200 schema to allow the <Address> element to contain telephone numbers. As illustrated below, the present invention enables such an extension of the <Address> tag; the polymorphism feature allows the extended <Address> tag to be
15 used in instance documents of type *PurchaseOrder*, while preserving the integrity of the *PurchaseOrder.so* schema and the existing instance documents of that type.

 The <Address> tag may be extended by using the SOX schema language to create a small document type *ContactAddress*, whose corresponding schema *ContactAddress.so* 204 extends the *CBL.so* 216 definition of <Address> to include a telephone number. The
20 extended tag, or element, is referred to as <Contact>, and this element is defined in *ContactAddress.so*, which is given as follows:

 <schema uri = "ContactAddress.so">
 <namespace prefix = "CBL" uri = "CBL.so"/>
 <elementtype name = "Contact">
25 <extends prefix = "CBL" type = "Address">

<append>

<element type = "PhoneNumber" occurs = "*" />

</append>

</extend>

5

</elementtype>

</schema>

003210" 47556460
0949334 04300
The new document type *ContactAddress* includes an identifier 206 for *CBL.sox* 216. A document instance 208 of type *PurchaseOrder* incorporates the new <Contact> tag by import statements which reference the schemas *ContactAddress.sox* 204 and 10 *CBL.sox* 216 respectively. Note that the <Contact> tag may be used in any place in the document instance reserved for the original <Address> tag.

The benefits of polymorphism are apparent from this example: we have extended the <Address> tag to create the <Contact> tag by writing a new, short document type 15 *ContactAddress*. Thus the new document type *ContactAddress* extends the functionality of the original *PurchaseOrder* document type while preserving the integrity of *PurchaseOrder*.

Without support for polymorphism, extensions to the <Address> tag would require a rewrite of the *PurchaseOrder*. This would alter a fundamental document type which is 20 an agreed upon standard amongst trading partners, one upon which a number of document instances and transactions are constructed, in order to accommodate a minor change. As a result, either (1) every trading partner would have to agree on the new *PurchaseOrder*, and software would need to be rechecked to ensure compliance with the new definition, or (2) the new schema would have a different name, and each time a trading partner wishes to

send a purchase order, they would need to ensure whether the other partner supports the new *PurchaseOrder* or would need a translation to the old version.

To support polymorphism, the schemas should have the following characteristics:

- The schemas should be available in a generally available repository to enable trading partners to retrieve them dynamically. The schema identifiers 202 206 210 212 214 should have globally unique names, aiding their dynamic discovery and loading
- When a trading partner receives a document instance, the `<?import . . . >` statement lists the schemata required to correctly parse it. As such, the recipient should be able to follow the identifiers 212 214 following the import statements in a document instance 208 to dynamically load the new schemata

As such, the enhanced schema languages introduce new challenges to the implementation of a document exchange system. One of these challenges arises from the fact that the schemas in such languages evolve. To facilitate an e-commerce document exchange system, documents which are written prior to schema modifications should be able link at the time they are parsed to the modified schema. As the revised schema may reside in a different physical location in the document exchange system, the link to the schema in the document instance, which was written prior to the schema change, should remain valid. As such, the use of polymorphic documents within the document exchange system entails a need for permanent, location independent identifiers for schemas.

008210" 47556460

E. Modularity and the Use of Persistent, Location-Independent Identifiers

It is also desirable for XML entities to exhibit modularity, i.e., to allow XML entities to be re-used. To illustrate the desirability of this feature, suppose there is an XML document schema which is well-understood, and which defines tags that may be used in multiple document instances. If such a schema is available, it is desirable to re-use this schema in the multiple instances, rather than re-write it for each instance.

In order to re-use a schema in multiple document instances, it is desirable for the schema to have a universal name, which may be used by any of the document instances referring to the schema. This name should also be persistent, so that document instances referring to the schema remain valid indefinitely. Additionally, it is desirable for such names to be location-independent, so that references to the schema remain valid even if the schema locations change. Thus the modularity of XML code also suggests a need for persistent, location-independent identifiers for XML entities.

F. Identifying Schemas with URNs

The invention offers a solution to the problems addressed above. In an embodiment of the invention, schemas are identified by static, location independent names. In a preferred embodiment, these identifiers include Uniform Resource Names, or URNs. Uniform Resource Names are described in RFC 2079. URNs are names for resources which may reside on LANs, WANs, or on the Internet. These names are characterized by two signal features:

- 1) URNs are static. As explained in RFC 2141, URNs are designed to last indefinitely, irrespective of changes in the configuration of the computer system on which the resources identified by URNs reside. This is in stark contrast to network addresses, IP addresses, or file locations, all of which

identify physical locations on a network, and are invalid if the physical locations change.

- 2) URNs are location independent. This also contrasts with network addresses and file locations. A system resource identified by a URN will retain that URN even if its network location changes, which does not hold true for its IP address, LAN address, or file location.

In an embodiment of the invention, each schema is identified with a URN. This is illustrated in figure 2. The document instance 208 of type *PurchaseOrder* identifies the schemas *PurchaseOrder.sox* 200, *ContactAddress.sox* 204, and *CBL.sox* 216, by their respective URN identifiers 210, 212, 214. Likewise, the definitions for *PurchaseOrder.sox* 200 and *ContactAddress.sox* 204 identify *CBL.sox* 216 by its URN identifiers 202 206.

The syntax of URNs is specified in RFC 2141. They are specified in the following format:

<URN> ::= "urn:" <NID> ":" <NSS>

where <NID> is a Namespace Identifier, and <NSS> is a Namespace Specific String. An illustration of a URN is provided by the URN for the *PurchaseOrder.sox* 200 schema in the invention, which is given by:

urn ::x-commerceone:document:com:commerceone:marketsite:businessservices:PO.sox\$1.0

wherein the NID is

x-commerceone

and the NSS is

document:com:commerceone:marketsite:businessservices:PO.sox\$1.0

When an XML processor reads a schema, the processor locates the schema from the URN. This requires resolving the URN to a physical location, such as a network location, URLs, or file location. As such, embodiments of the invention also include a method for resolving URNs to physical locations.

5

G. Resolving URNs via a Registry

In an embodiment of the invention, URNs are mapped to physical locations by converting the URNs to URIs, or Uniform Resource Identifiers. Uniform Resource Identifiers, which are described in RFC 2396, identify physical locations for computer system resources. URIs may take the form of network locations such as HTTP, FTP, or Telnet sites, or file locations within a computer system. To resolve URNs to physical locations, the present embodiment maps URNs to URIs, and correspondingly maps permanent, location independent identifiers to actual physical locations. The method used for this mapping should be scalable, in order to facilitate the addition of new schemas and document types to the marketplace, and should allow for easy retrieval and updating, as the network locations of the schemas may change frequently. Moreover, the mapping method should enable each server in the marketplace with an XML Processor 302, i.e., buyer sites 102, seller sites 104, transaction servers 108, to access the schemas, and interpret documents. As such, the method of URN resolution should also be accessible to each server in the marketplace.

10
15
20

Embodiments of the invention address these issues by employing a registry for mapping URNs to URIs. The registry resides on a directory service which is accessible by any site in the electronic marketplace, i.e., by any of the trading partner sites or any of the transaction servers within the transaction services network. Figure 1 depicts this feature of the electronic marketplace. The buyer sites 102, seller sites 104, and the transaction

25

servers 108 all communicate with the URN registry in the Directory Server 110. This layout lends scalability to the system, as any transaction servers or trading partner servers may also communicate with the registry.

To resolve the URNs by use of the registry, an access protocol is needed to retrieve the schema name from the x.500 directory. An embodiment of the invention utilizes the Lightweight Directory Access Protocol, or LDAP. The LDAP v3 protocol is a client-server protocol for performing lookups on a remote directory server. In the invention, the protocol is used to enable the transaction servers and trading partners to retrieve resource locations via the registry.

Figure 3 depicts the use of LDAP to retrieve schema locations from a directory. An Entity Manager 304 receives an XML document instance 300. The entity manager is an application which may run on any transaction server or trading partner site: the application manages XML document streams and facilitates the opening and tracking of URI based resources which the XML document system requires or references. The information collected by the Entity Manager 304 is passed to an XML Processor 302, which is responsible for understanding well-formed XML syntax. Upon parsing the XML document instance 300, the XML Processor 302 sends a URN for the schema to the Entity Manager 304. The Entity Manager 304 engages an LDAP Lookup Service 306 which searches for a URI corresponding to the URN in a directory service 308.

In an embodiment, the LDAP compliant directory service 308 used to resolve the URNs comprises an X.500 server. In alternative embodiments, the directory service 308 may be any other type of directory service which has functionality similar to LDAP v3. The X.500 directory server is described in detail in RFC 2253. In an LDAP compliant directory service such as X.500, the directory service stores primary keys as

“Distinguished Names”, which are commonly referred to as “DN”s. A DN is composed of a string of attribute values. The types of attributes include:

CN Common Name

OU Organization Unit Name

5 **O Organization Name**

A DN comprises a string of one or more attribute values for the attribute types listed above. The attribute types are organized in a tree-based hierarchy, which facilitates the search and retrieval of distinguished names. In the invention, the DN serves as the primary key for retrieving a corresponding URN from the x.500 directory.

10 Prior to using the DN as a key for retrieving a corresponding URI for a schema, the URN for that schema should be mapped to the DN. This step is performed by use of an LDAP URL. The LDAP URL standard is described in RFC 2255. This standard specifies a syntax for converting URNs to Distinguished Names. In an embodiment of the invention, the Entity Manager 304 is responsible for converting the URN to an LDAP
15 URL. The Distinguished Names are then available to the LDAP protocol to search LDAP compliant directories. The search through the directory is performed by the LDAP Lookup Service 306.

The schema retrieval procedure outlined above comprises the following steps:

- 20
- 1) Take the input URN, perform a mapping to an LDAP URL
 - 2) Take the LDAP URL from step 1 and convert to a DN to search the LDAP directory.
 - 3) Locate the URI corresponding to the URN by searching the LDAP directory with the DN.
 - 4) Locate and retrieve the schema by use of the URI

The steps of this procedure shall be illustrated by the following, non-limiting example, in which a schema is retrieved from its URN.

H. Example: Retrieving a Purchase Order Schema from its URN

5 In this example, a *PurchaseOrder.sox* 200 schema is to be retrieved by an XML Processor 302. The URN for *PurchaseOrder.sox* 200 is specified as :

urn::x-commerceone:document:com:commerceone:marketsite:businessservices:PO.sox\$1.0

which comprises the following components:

NI = x-commerceone

10 **NSS = document:com:commerceone:marketsite:businessservices:PO.sox\$1.0**

In an embodiment of the invention, the Namespace Identifier, or NI, for all schemas is "x-commerceone." The Namespace Specific String, or NSS, is divided into two parts, one representing the "logical directory" and the other portion representing the version of the document. These two portions of the NSS are delimited by the "\$" token.

15 Hence the logical directory is given by

document:com:commerceone:marketsite:businessservices:PO.sox

and the version is given as

1.0

20 The logical directory is a hierarchical name for the document which is delimited by colons ":". This hierarchy corresponds to the hierarchy in the LDAP directory relative to a Schema Root in reverse order. The Schema Root is a Distinguished Name representing the logical origin for the schema entries in the directory tree. In this example, the Schema Root is given by:

25 **ou=schema, o=Marketplace B**

The next step is to convert the URN as specified above into a corresponding LDAP URL. The format for a standard LDAP URL, as specified is RFC 2255, is given as follows:

Ldapurl = scheme "://" [hostport] ["/" [DN ["?" [attributes] ["?" [scope] ["?" [filter] ["?" extensions]]]]]]]

The parameters used in the mapping are "Scheme", "hostport", and "DN". The scheme in this case, equals "LDAP". The hostport will be given as "/". This token indicates to the Entity Manager 304 that the host and port will be resolved at during the directory lookup. The DN for the Purchase Order in the present example will be:

**cn= PO.sox,
ou = n1_0
ou=businessservices
ou=marketsite
ou=commerceone
ou = com**

The remaining parameters in the LDAP definition are not used. Hence the LDAP URL for the Purchase Order should be

LDAP:///cn=PO.sox,ou=n1_0,ou=businessservices,ou=marketsite,ou=commerceone,ou=com

An example of an algorithm which performs the mapping is given as follows:

- 1) Initialize string variable for storing the output LDAP URL
- 2) Insert "LDAP:///" into the variable
- 3) Remove the prefix "urn:x-commerceone:document" from the input URN.
If this prefix is not present, then trigger an exception
- 4) Parse each token in the URN delimited by ":".

- 003210" 4TSE6450
- 5) Insert each token into a LIFO buffer
 - 6) The remaining portion of the input URN is the version component.
Remove the "\$" delimiter and store the remainder as a version string.
 - 7) If the string is not "1.0", the schema is not version compliant, so trigger an
exception
 - 8) Remove the first token from the LIFO buffer and store into a string variable
labeled "DocName"
 - 9) Create a string for the DN by inserting the DocName string preceded by
"cn=" and terminated with ","
 - 10) If the version string starts with a digit, it is prefixed with "n" and the "." is
replaced with a "_". In the present example, the version string "1.0" will be
mapped to "n1_0"
 - 11) Append the modified version string to the DN prefixed by "ou=" and
terminated with ","
 - 12) For each token in the LIFO buffer, prefix the token with "ou=", terminate
the token with "," and append the modified token to the DN string. The
final token in the LIFO buffer should be terminated with "."
 - 13) Insert the DN string into the LDAP URL

20 The result of the mapping algorithm applied to the current URN is

LDAP:///cn=PO.sox,ou=n1_0,ou=businessservices,ou=marketsite,ou=commerceone,ou=com

The DN embedded in the LDAP URL is used to by an LDAP Lookup Service 306 to
search the x.500 directory.

Figure 4 is an illustration of the directory tree. The nodes of the tree correspond to
25 attributes in the DN, and the leaves contain URIs for various schemas. The LDAP Lookup

Service uses the third "/" as an indication of the host and port, which brings it to the Schema Root Node 400. The DN is now traversed in reverse order. The "ou=com" attribute brings us to the corresponding node in the LDAP tree 402. The next attribute is ou=commerceone, which has a corresponding node 404. The path 406 can be seen to
5 correspond directly to the DN specified in the LDAP URL, wherein each attribute "ou" has a corresponding node in the path 406. The search ends at the leaf node 408, which contains the desired URI, which in this case, is <http://www.mp.com/po.sox>

The schema retrieval system described in this example meets the criteria which were established earlier, such as persistence and location-independence, and exhibits a
10 number of virtues which may not be immediately apparent. These features merit further elaboration.

I. Advantages of the Invention

Amongst the criteria listed for the schema identifier are persistence and location independence. The persistence and location independence of the URN is achieved by the provision of a centralized URN Repository which is easily updated. The registry, in an embodiment of the invention, is an x.500 directory, with a directory tree as given in Figure 4. A physical location for a given resource can be updated simply by updating the corresponding leaf node. For instance, suppose the location of the Purchase Order schema in the example above is changed to <http://www.marketsite.net/foo>. This can be facilitated simply by replacing the current contents of the leaf node 408 with the new URL. Hence the corresponding URN is persistent, for the URN remains constant even though the old URL is obsolete. The URN is also location independent, as the physical location of the resource is at a new network location while the URN has remained constant. Thus, any documents referring to the schema by the URN remain valid under the location change.

Maintaining a centralized URN Repository lends scalability, integrity, and flexibility to the schema retrieval system. The provision of a centralized repository eliminates a need for replicated lists of schema locations. This frees memory in the system for other uses. The centralized repository also contributes to the scalability of the system, as any new server added to the system can access schemas simply by accessing the URN Repository. The elimination of replicated lists also preserves the integrity of the schema locations, for the system makes updates to the registry relatively simple, as elaborated above, and the centralized nature of the repository eliminates the possibility of contradictory location information for schemas. Embodiments of the invention also expedite schema retrieval. Because the URN Repository is stored in a directory tree, the search for the network location is faster than a flat file repository by a logarithmic factor.

003210-2755460

Additionally, the object-oriented features supported by the enhanced schema language of the present invention enable the safe extension and evolution of elements defined in the language. Type extension allows elements to be defined as extensions of pre-existing elements. Polymorphism allows the extended elements to be used in contexts reserved for the original elements. By coupling polymorphism with type extension, the schema language enables type safe extensions at runtime. Thus document types and applications can evolve separately on the transaction services network.

As such, the extension mechanisms in the schema language allow trading partners to modify existing document types easily while preserving the integrity of document instances and applications that rely on the original document types. Trading partners can modify or extend existing document types to accommodate novel transactions while preserving the integrity of applications that rely on the original document types. Thus the enhanced schema language lends flexibility in creating and modifying transactions while preserving the integrity of existing applications on the transaction services network.

J. Alternative Embodiments

An alternative embodiment for the repository includes a federated directory service, in which the individual nodes of the directory service reside on separate servers. In an embodiment of the invention, schemas unique to particular trading partners are stored on sites which are operated by the trading partners. For instance, a particular buyer may modify a *PurchaseOrder* schema to suit their requirements. In an embodiment of the invention, those nodes of the LDAP tree which lead to a leaf with the URI for the modified *PurchaseOrder* reside on sites under the control of the buyer. This embodiment enables the buyer site to update nodes leading to a particular schema location itself, without going through a central directory service. As such, this embodiment decentralizes

CLAIMS

What is claimed is:

- 1 1. A computer network system for processing electronic documents encoded in a
2 markup language, the computer network system comprising:
3 a communications channel;
4 a first server, the first server being in communication with the communications
5 channel, wherein the first server stores a first schema, the first schema including a
6 definition for a first element in the markup language, the definition of the first element
7 further including a first sub-element in the markup language;
8 a second server, the second server being in communication with the
9 communications channel, wherein the second server stores a second schema, the second
10 schema including a definition for a second element in the markup language, the definition
11 of the second element further including
12 the first sub-element
13 a second sub-element in the markup language.
- 1 2. The computer network system of claim 1, wherein the communications channel
2 includes a local area network (LAN).
- 1 3. The computer network system of claim 2, wherein the local area network further
2 includes an Ethernet LAN.
- 1 4. The computer network system of claim 1, wherein the communications channel
2 includes a wide area network (WAN).
- 1 5. The computer network system of claim 1, wherein the communications channel
2 includes the Internet.

1 6. The computer network system of claim 1, wherein the markup language comprises
2 XML.

1 7. The computer network system of claim 6, further comprising:
2 a third server, the third server in communication with the communications channel,
3 wherein the third server stores a first XML document instance, wherein the first document
4 instance is interpreted by use of the first schema.

1 8. The computer network system of claim 7, wherein the first document instance
2 includes the first element.

1 9. The computer network system of claim 7, wherein the first document instance
2 includes the second element, such that the second element is used in a location reserved
3 for the first element in the first document instance.

1 10. The computer network system of claim 9, further comprising:
2 a fourth server, the fourth server in communication with the communications
3 channel, wherein the fourth server stores a second XML document instance, wherein the
4 second document instance is interpreted by use of the second schema.

1 11. The computer network system of claim 10, wherein the second document instance
2 includes the second element.

1 12. The computer network system of claim 11, wherein the second element is used in a
2 location reserved for the first element in the second document instance.

1 13. The computer network system of claim 10, wherein the first document instance and
2 the second document instance correspond to a document type, wherein the
3 document type is at least one of a purchase order, a purchase order
4 acknowledgement, an order status check, an availability check, a price check, an
5 invoice, an invoice acknowledgement.

14. A method of extending a definition of a first tag used in a first electronic document, wherein the electronic document is encoded in a markup language, and the document is stored on a server in a computer network, the method comprising:

- defining the first tag in a first schema, wherein the definition of the first tag includes a plurality of elements from the markup language;
- defining a second tag in a second schema, wherein a definition of the second tag includes
 - the plurality of elements from the markup language
 - an additional element from the markup language;
- accessing the first schema and second schema in the first electronic document, wherein the first tag and the second tag are used to encode text within the first electronic document.

15. The method of claim 14, further comprising:

parsing the first electronic document, wherein the first electronic document is
 parsed by a parser for the markup language, the parser being stored on the server.

16. The method of claim 15, wherein the second tag is used in a location reserved for the first tag in the electronic document.

17. The method of claim 16, wherein the markup language is XML.

18. The method of claim 17, wherein the first document corresponds to at least one of a purchase order, a purchase order acknowledgement, an order status check, an availability check, a price check, an invoice, an invoice acknowledgement.

19. The method of claim 14, wherein the first electronic document includes the first tag and the second tag.

20. The method of claim 14, further comprising:

accessing the second schema in a second electronic document, wherein the second tag is used to encode the second electronic document.

21. The method of claim 20, further comprising:

parsing the second document, wherein the second electronic document is parsed by a parser for the markup language, the parser being stored on the server.

22. The method of claim 21, wherein the markup language is XML.

23. The method of claim 22, wherein the second document corresponds to a commercial transaction.

24. The method of claim 23, wherein the commercial transaction is selected from the group consisting of a purchase order, a purchase order acknowledgement, an order status check, an availability check, a price check, an invoice, an invoice acknowledgement.

25. A computer network system for processing a document instance of a markup language, the computer system comprising:

means for defining a first schema in the computer network system;

means for extending a definition the first schema by use of a second schema
residing on the computer network system;

means for importing the second schema into the document instance.

26. The computer network system of claim 25, wherein the markup language is XML.

27. The computer network system of claim 25, wherein the definition of the first schema includes a definition of a tag.

28. The computer network system of claim 27, further comprising:

means for extending the definition of the tag by use of the second schema.

29. The computer network system of claim 28, wherein the document instance includes the tag.

30. The computer network system of claim 28, further comprising:

2 means for using an extension of the tag in the document instance, wherein the
3 extension of the tag is used in a location reserved for the tag in the document instance.

1 31. In a computer network system comprising a plurality of servers, a method of
2 interpreting an XML document, the XML document residing on a first server from the
3 plurality of servers, the method comprising:

4 accessing a first schema from a second server in the plurality of servers, wherein
5 the first schema defines one or more elements used in the document instance;

6 accessing a second schema from a third server in the plurality of servers, wherein
7 the second schema modifies at least one element from the one or more elements used in
8 the document instance.

1 32. The method of claim 31, wherein the computer network system is used to conduct
2 a commercial transaction between two or more trading partners.

1 33. The method of claim 32, wherein the XML document corresponds to the
2 commercial transaction.

1 34. The method of claim 33, wherein the commercial transaction is one of a purchase
2 order, a purchase order acknowledgement, an order status check, an availability
3 check, a price check, an invoice, an invoice acknowledgement.

1 35. The method of claim 31, further comprising:
2 parsing the XML document, wherein the document is parsed by an XML Processor
3 residing on a fourth server from the plurality of servers.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it contains a valid OMB control number.

DECLARATION FOR UTILITY OR DESIGN PATENT APPLICATION (37 CFR 1.63) <input checked="" type="checkbox"/> Declaration Submitted with Initial Filing OR <input type="checkbox"/> Declaration Submitted after Initial Filing (surcharge (37 CFR 1.16(e)) required)	Attorney Docket Number	16603-708
	First Named Inventor	Matthew Fuchs et al.
	COMPLETE IF KNOWN	
	Application Number	
	Filing Date	January 28, 2000
	Group Art Unit	
	Examiner Name	

As a below named inventor, I hereby declare that:

My residence, post office address, and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

SYSTEM AND METHOD FOR SCHEMA EVOLUTION IN AN E-COMMERCE NETWORK

(Title of the Invention)

the specification of which
☒ is attached hereto

OR

☐ was filed on (MM/DD/YYYY)

as United States Application Number or PCT International

Application Number ☐ and was amended on (MM/DD/YYYY) ☐ (if applicable).

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment specifically referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR 1.56.

I hereby claim foreign priority benefits under 35 U.S.C. 119(a)-(d) or §365(b) of any foreign application(s) for patent or inventor's certificate, or 365(a) of any PCT international application which designated at least one country other than the United States of America, listed below and have also identified below, by checking the box, any foreign application for patent or inventor's certificate, or of any PCT international application having a filing date before that of the application on which priority is claimed.

Prior Foreign Application Number(s)	Country	Foreign Filing Date (MM/DD/YYYY)	Priority Not Claimed	Certified Copy Attached?
